Discharge SafeDock - Connection System

SafeDock* is a revolutionary system allowing a very simplified and fast docking operation while providing high containment.

The system consists of a single dead zone free docking tube with an automated cover to close the system. A side port featuring a continuous liner system is used for the removal of the inliner. The big bag spout is sealed by means of a flexible single-use ring which can be easily removed with the remaining liner in a closed manner through the side port. This high safety system guarantees perfect sealing at all times without external energy sources.

Very efficient cleaning (CIP) is possible by the optional easy-to-install CIP cover.

Design

- Product contact parts: AISI 316L or better
- Outlet flange DN 300 PN10
- Big bag spout Ø 350 to Ø 550

Features

- High containment (OEB 4)
- User-friendly
- Side port to remove the liner and the ring
- High operational reliability
- Easy to clean, solvent resistant

Options

- Various materials (HC22, coatings)
- Cleaning lid with spray nozzle

* Patent pending
